# DOBIES OBJECTIVE

- To Develop a Reliable, Standard Dosimetric Method to Estimate Absorbed Dose, Dose Equivalent and Linear Energy Transfer (LET) Spectra in Biological Samples Exposed in Space Using :
  - Nuclear Track Detectors
  - TLDs
  - OSLDs

**High LET Radiation in LEO**

**GCR (Galactic Cosmic Rays)**

**SAA (South Atlantic Anomaly) Particles**

**Solar Energetic Particles**

**Albedo Neutrons and Protons Scattered from  
the Earth's atmosphere**

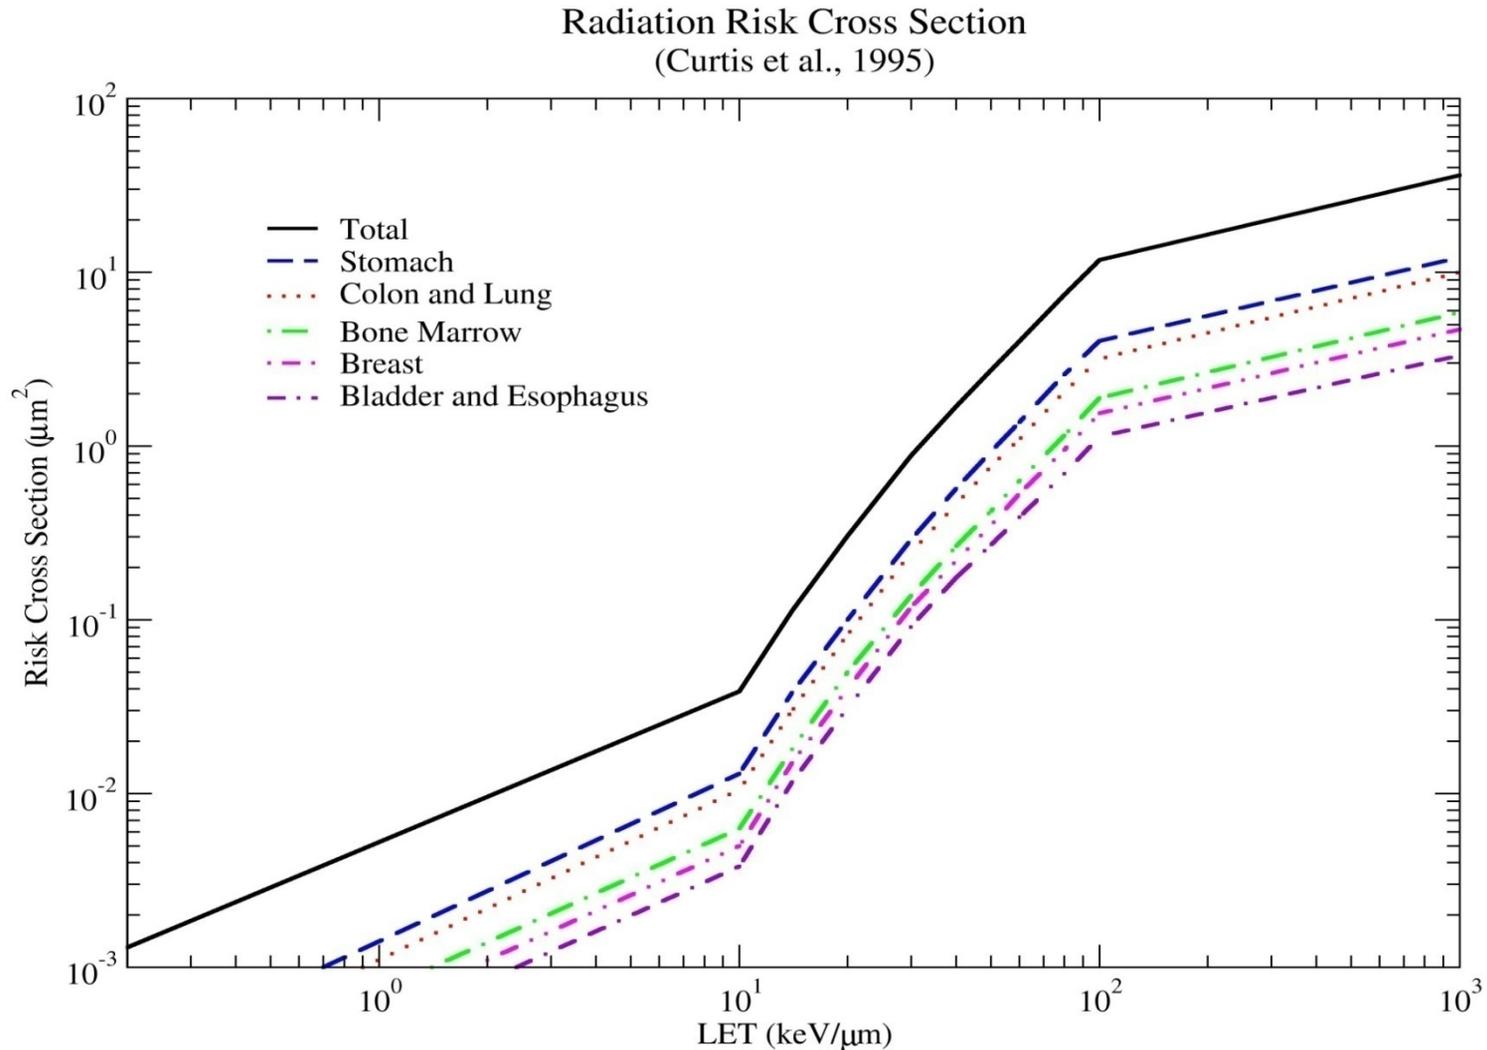

**Short Range Recoils & Fragments resulting  
from interactions between primary particles  
and nuclei of shielding & payload.**

# Radiation Damage

- High Energy Particles From All Of these Sources can Penetrate Humans and Bacteria In Space and Cause Damage Leading to effects Like Chromosome Abberations and Damage to DNA
- Bacteria Play an Important Role in Recycling of Organic Waste.
- They Can Be a Problem if Mutations Occur

# Importance of High LET Radiation

**Biological impact is dominated by high LET radiation**

**Figure 1: Risk Cross Section as the Function of LET**

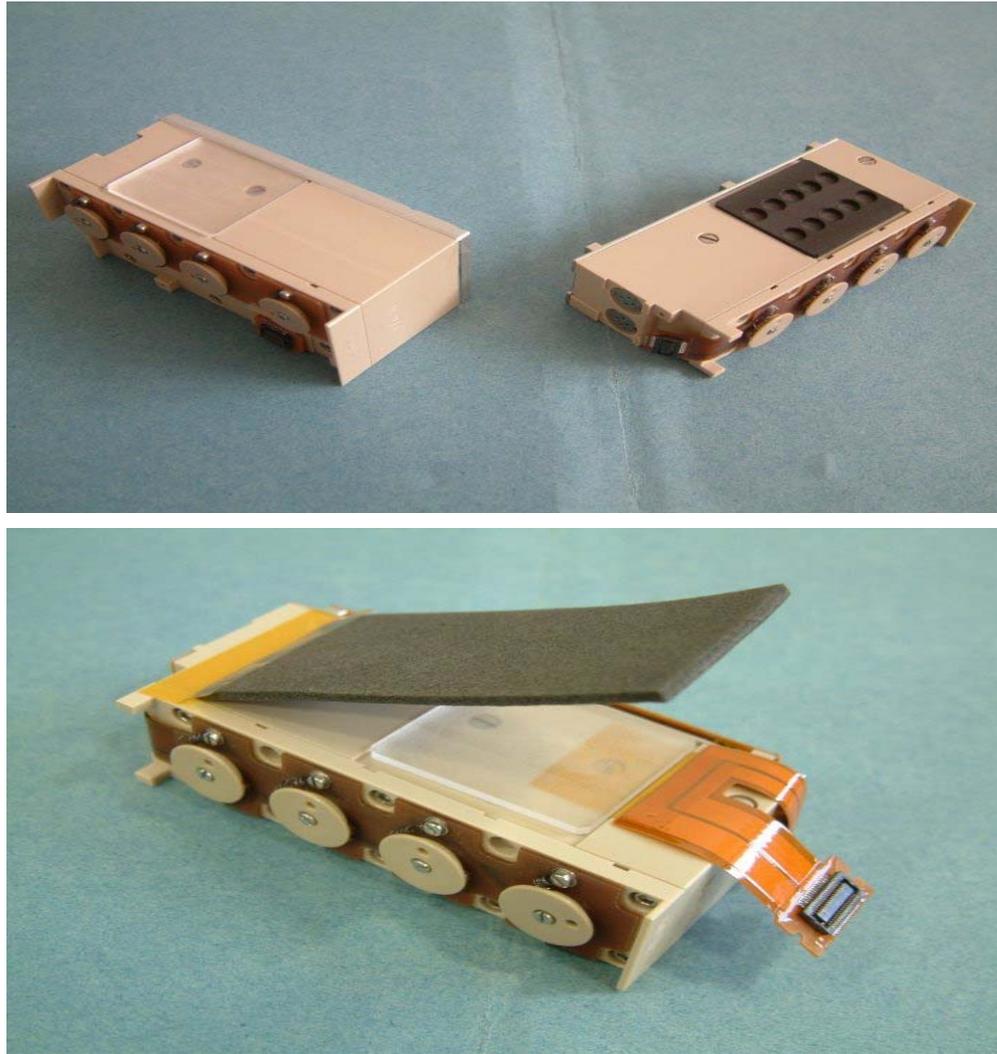

**Risk cross section from high LET ( $\geq 10$  keV/ $\mu\text{m}$ ) radiation is  
~ two orders higher than that from low LET ( $\leq 10$  keV/ $\mu\text{m}$ ).**

**Contribution from low LET can be treated as insignificant**

**Approach to DOBIES is the same as Matroshka**

**Employ Track Detectors and TLDs**

# Configurations of DOBIES Passive Dosimeters (TLDs/OSLDs + CR-39 PNTDs)

**Figure 2: Configurations of Dobies Passive Dosimeters**

# Exposure Time

**12 - 24 October 2008 with the exposure time of ~ 11.67 days in the Russian Zvezda service module on ISS.**

## Processing and Analysis

**After exposure the CR-39 detectors were recovered and chemically etched in JSC-SRAG (Space Radiation Analysis Group).**

**Data scan and analysis were conducted in JSC-SRAG and DIAS**

1/11/2010

DOBIES (WRMISS2009)

# LET Spectrum Method Using CR-39 Detectors

## LET Spectrum Method for Radiation Measurement Using CR-39

### (1) CR-39 Exposure and Chemical Etch

(a) Radiation Exposure of CR-39 Detectors

(b) Chemical Etch of CR-39 Detectors

(c) Bulk Etch Measurement

$$B = \frac{(m_1 - m_2)T_2}{2m_2} \left(1 - \frac{pT_2}{2A_d}\right)$$

### (2) Data Scan and Acquisition

Events were identified and the major and minor axes of the etched track cones on the CR-39 surface were measured by manual scan.

### (3) Data Analysis and LET Spectra Generating

Scanned data were then analyzed, the LET spectra were generated and the radiation quantities were obtained. **(To be continued)**

# Results Measured with CR-39 Detectors

Figure 3 shows integral LET spectra of dose equivalent measured with CR-39 detectors for DOBIES 2008, including that for HZEs (Stack 1).

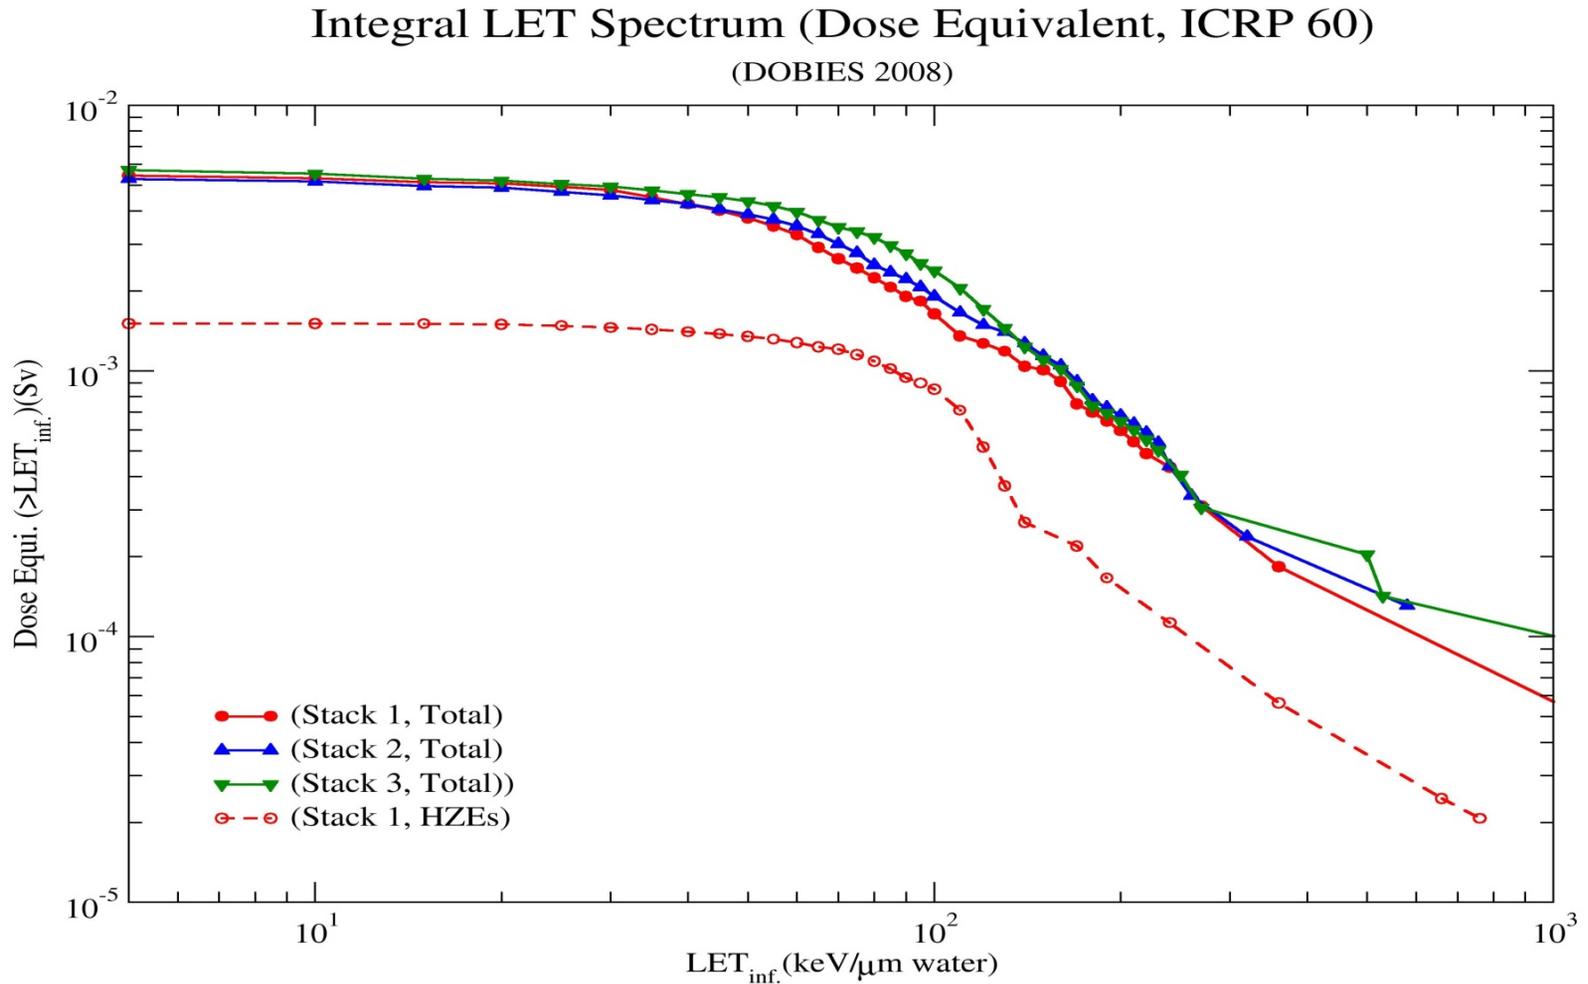

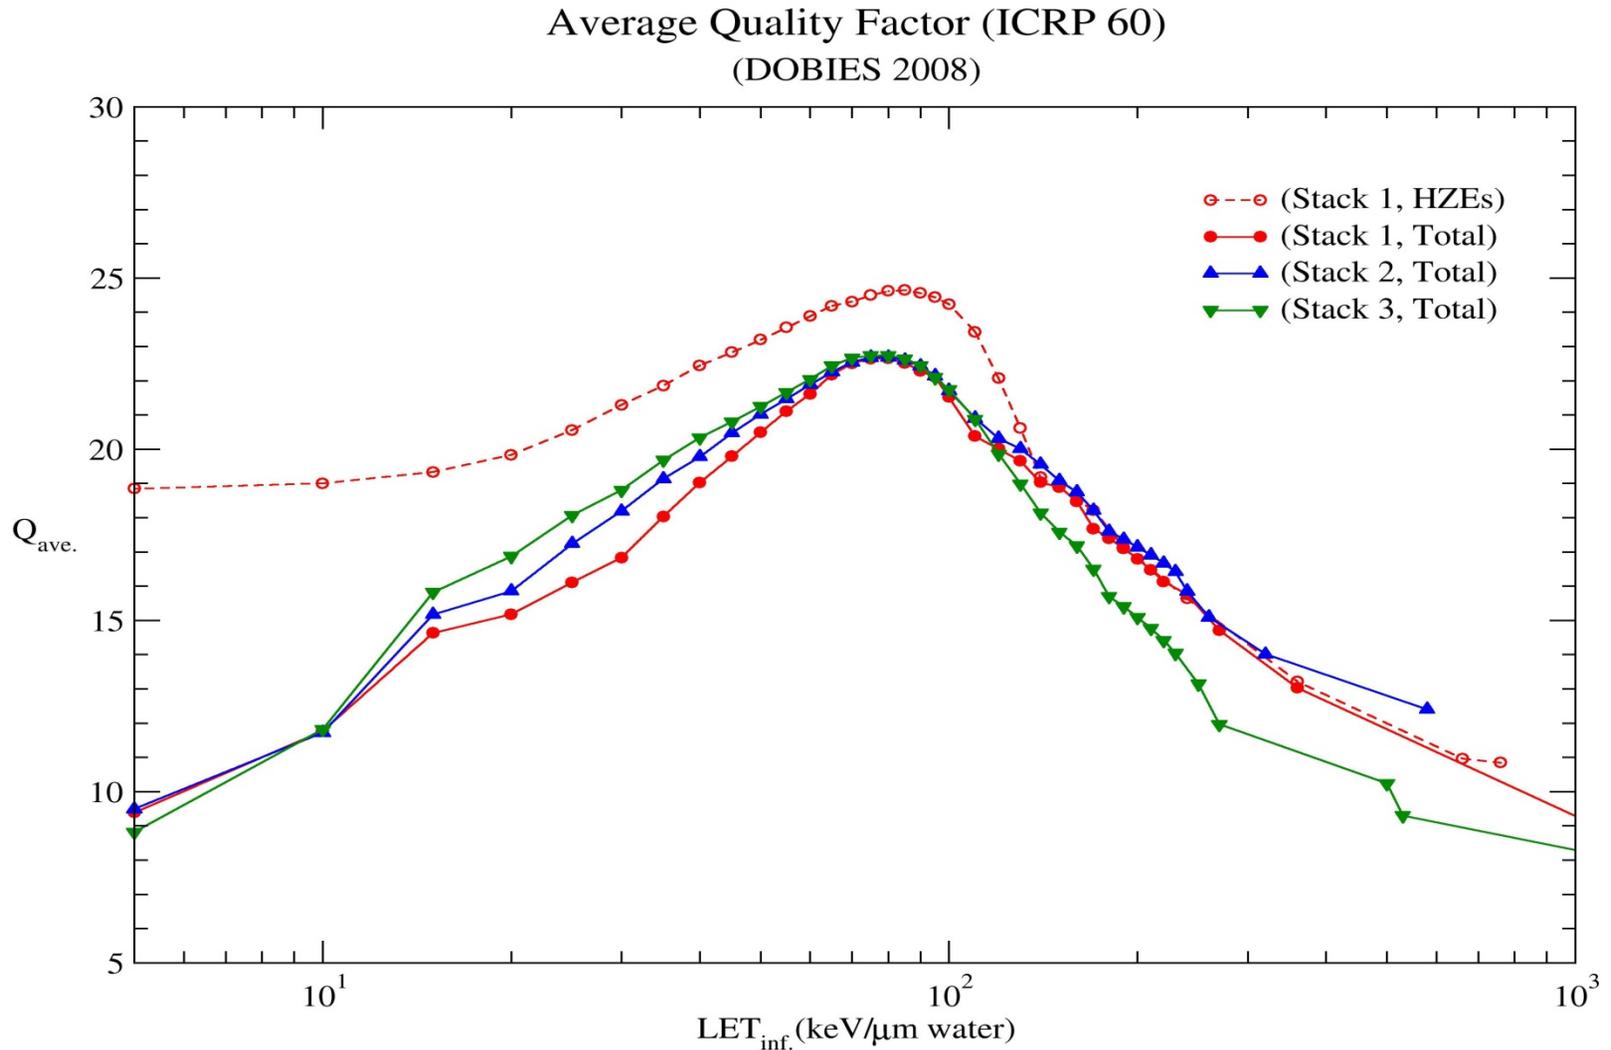

Figure 3: LET Spectra of Dose Equivalent (Total Means All Types of Particles)

**Figure 4 shows average quality factor measured with CR-39 detectors for DOBIES 2008, including that for HZEs (Stack 1).**

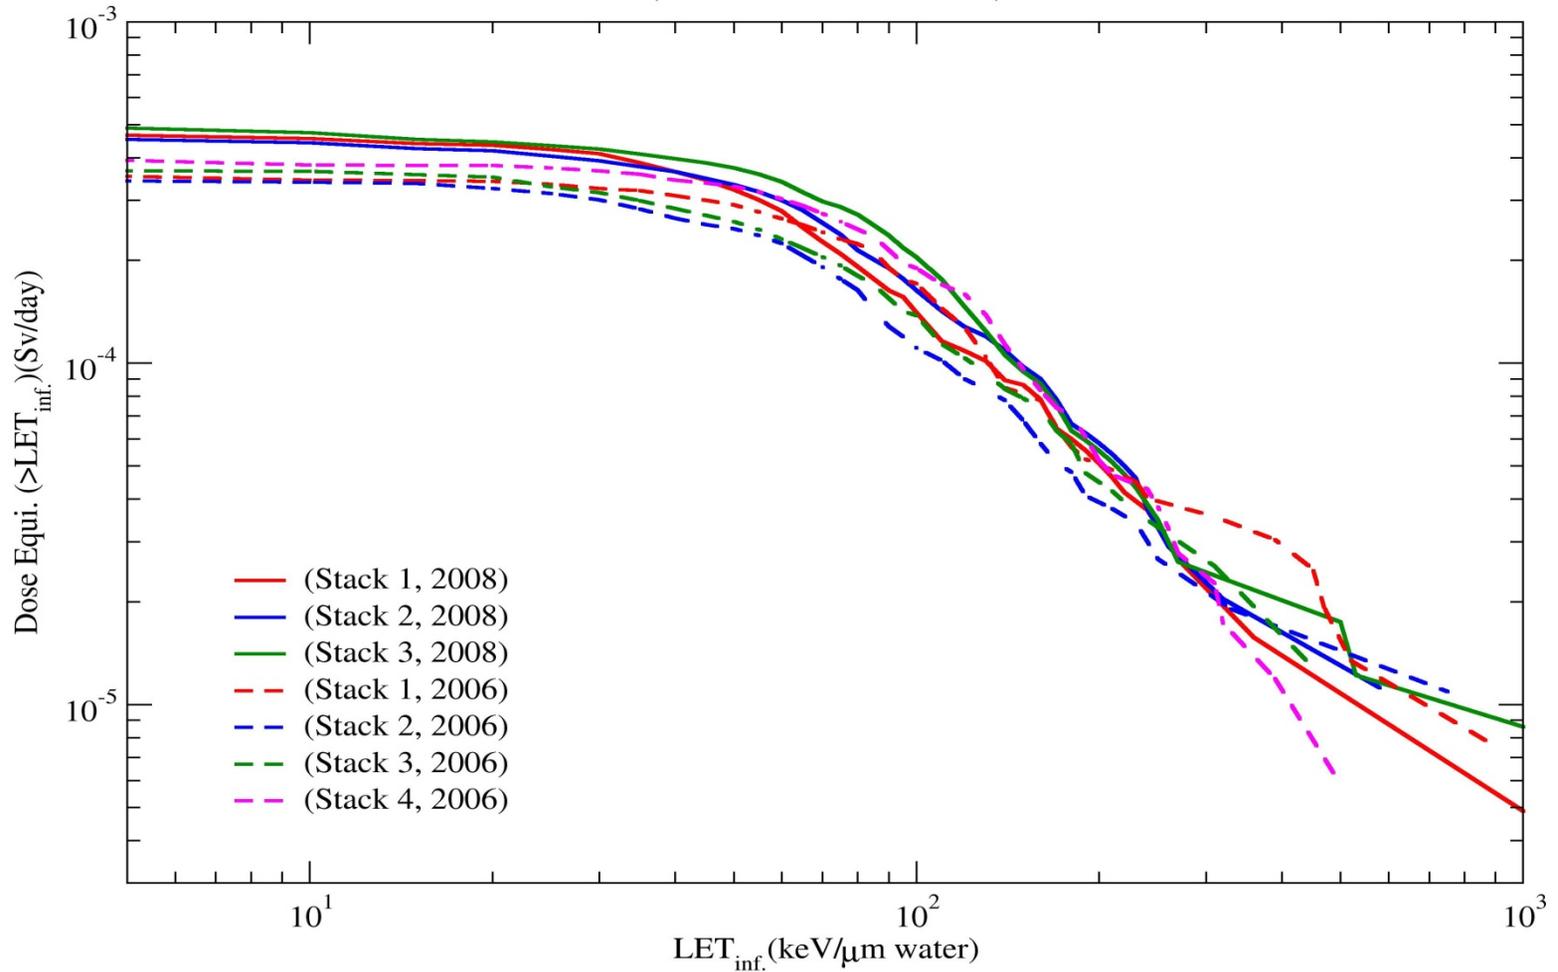

**Figure 4: Average Quality Factor for Dobies 2008 Experiments.**

**Figure 5 is a comparison of the dose equivalent measured in 2006 and 2008 and 2008 for DOBIES experiments.**

**Integral LET Spectrum (Dose Equivalent, ICRP 60)**

# RESULTS FOR RHODOSPIRILLUM RUBRUM

- The Belgian Team found that even at the low doses of the 2006 exposure, there was evidence that the bacterium was more sensitive to ionising radiation than to microgravity

# Conclusions

- 1. Results obtained with CR-39 detectors for DOBIES 2006 and 2008 experiments were consistent with that expected for the different phases of the solar cycle**
- 2. Radiation dose equivalent contributed by HZE particles is ~ 28% of total dose equivalent contributed by all types of particles.**

- **THANK YOU FOR LISTENING**
