Space Intercomparison/BRADOS

We conducted an intercomparison experiment for passive radiation dosimeters, Space Intercomparison/BRADOS, aboard the International Space Station (Russian Service Module).

Phase-1

- Intercomparison for passive dosimeters from five labs
- Exposure duration: 91.5 days

Phase-2

- Spacial distributions of dose (rate) at 5 locations
- Intercomparison for passive dosimeters of NIRS and IBMP
- Exposure duration: 268.5 days

Locations of BRADOS boxes and Averaged shielding

No. of Box	Location	Exposure duration (days)	Average shielding (g/cm ²)
A46	Starboard side	91.5	35.6
A41	Starboard side	268.5	35.5
A42	Port side	268.5	31.0
A43	Floor, Starboard side	268.5	33.2
A44	Starboard side	268.5	34.0
A45	Ceiling near the R-16, port side	268.5	40.3

Participants and detectors

NIRS-CHIYODA

Plastic detector (TT-A(CR-39): Chiyoda Technol corporation)

Glass detector (FD-P33-7: Chiyoda Technol corporation)

NIRS-NAGASE

Plastic detector (TD-1(CR-39), BARYOTRAK(CR-39): Nagase landauer Inc.)

Optical stimulated detector (OSL Al₂O₃:C : Nagase landauer Inc.)

Thermoluminescence detector (LiF(TLD-100): Nagase landauer Inc.)

IBMP

Plastic detector (TD-1(CR-39): Nagase landauer Inc.)

Thermoluminescence detector (TLD-100)

ATI

Plastic detector (TD-1(CR-39): Nagase landauer Inc.)

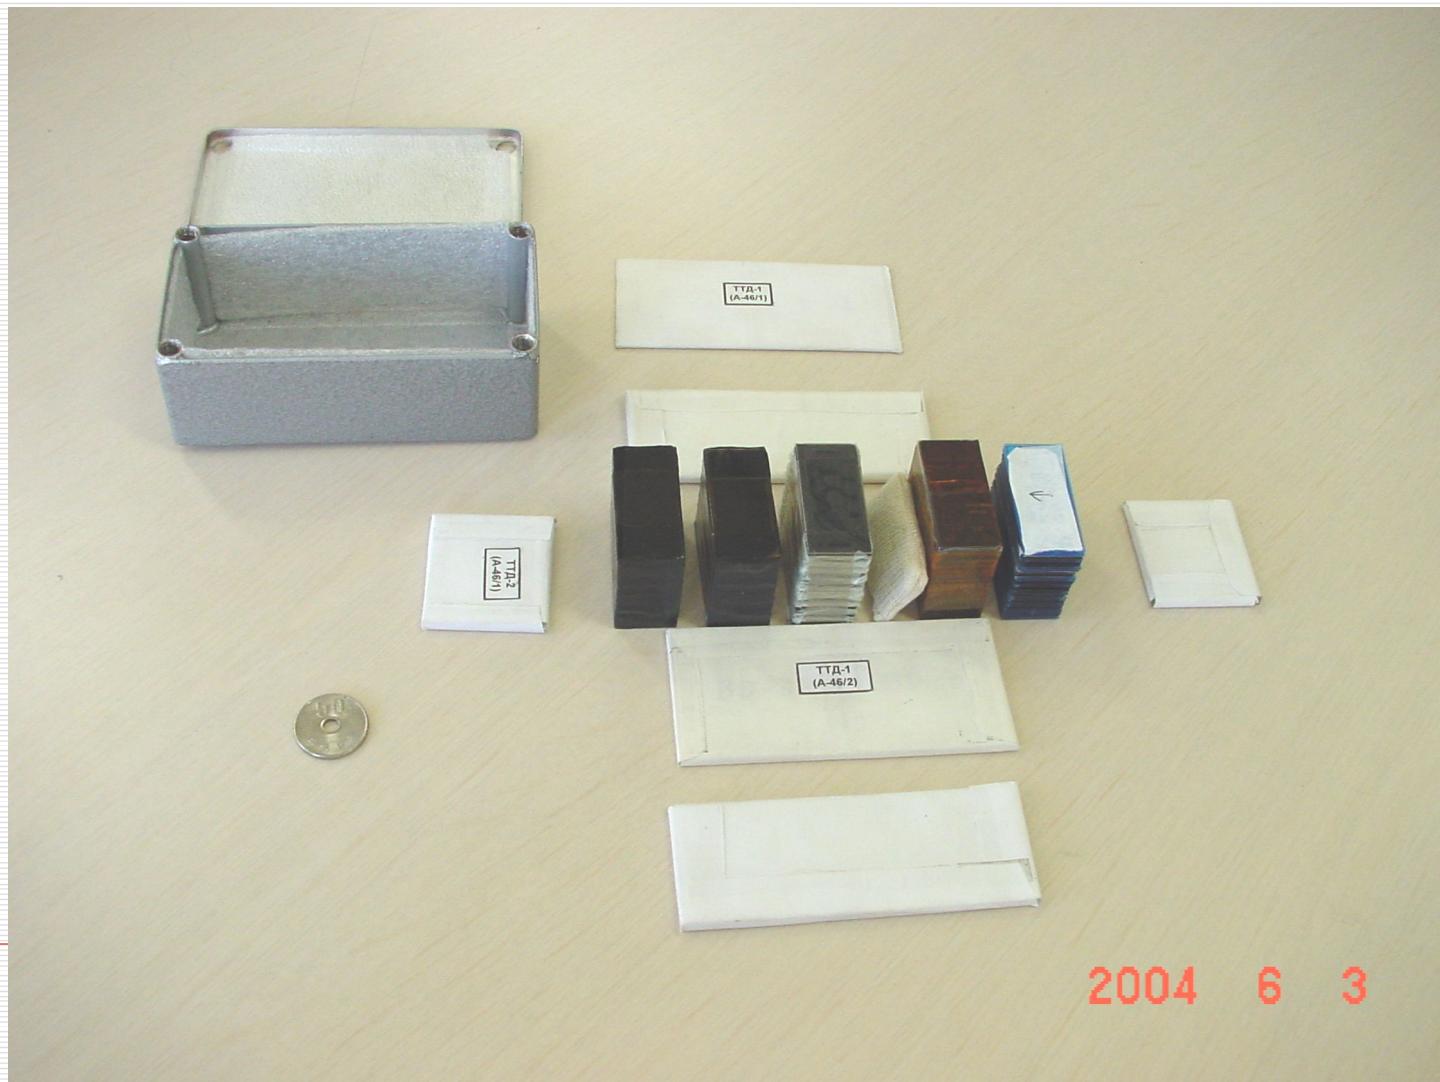

Thermoluminescence detector (LiF-300, 600, 700)

OSU/Eril research

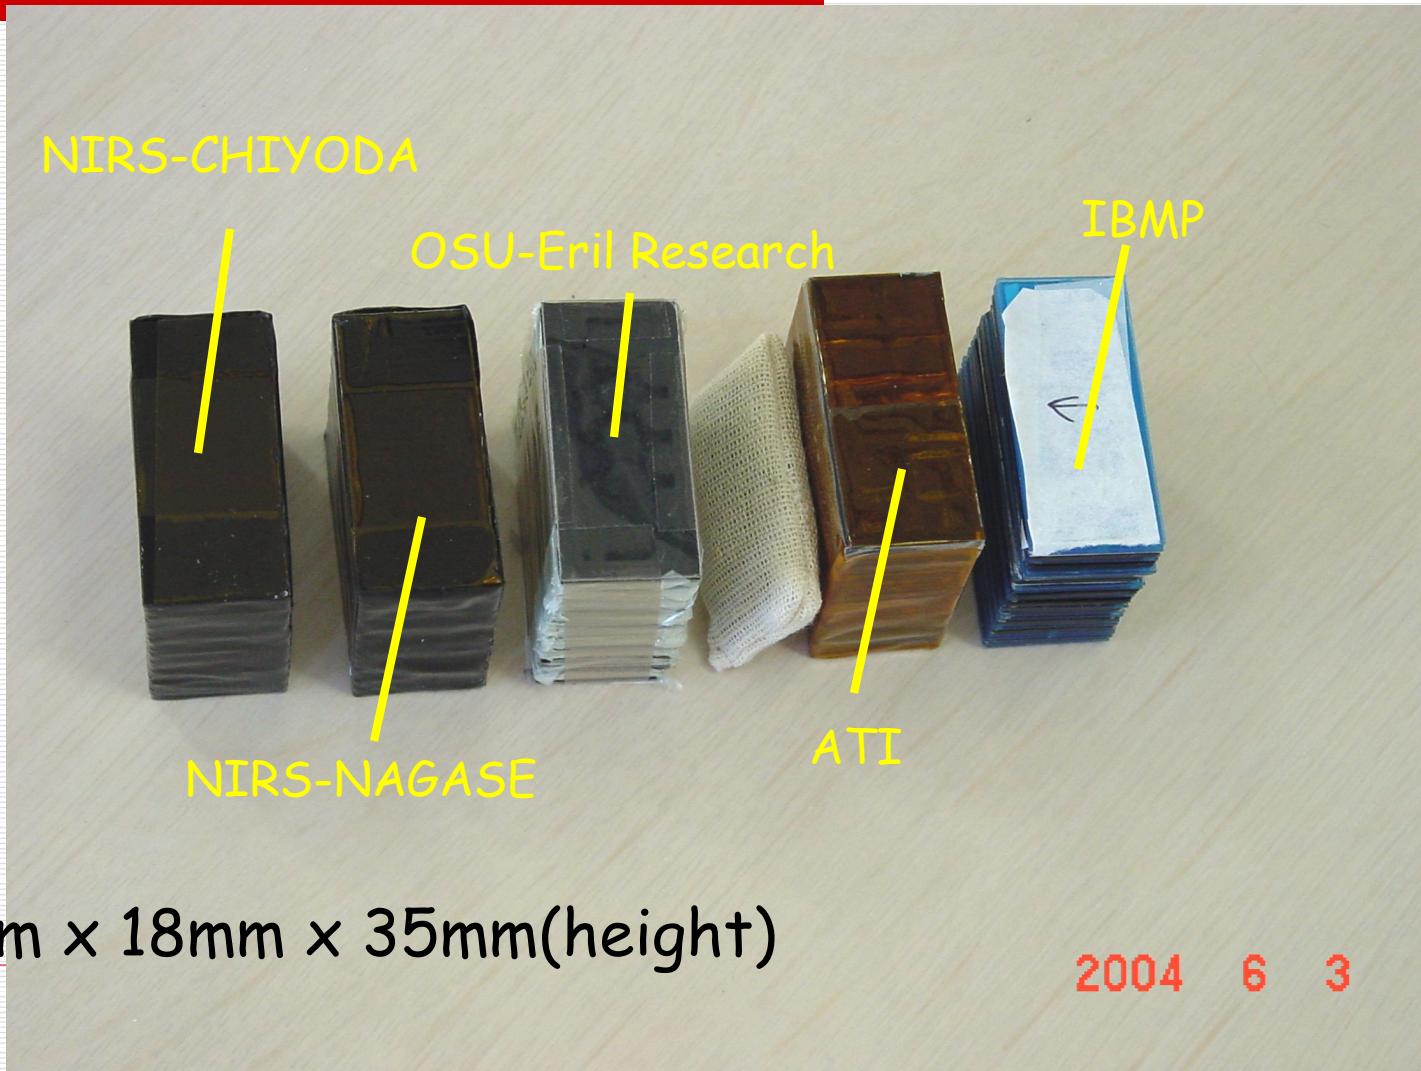

Plastic detector (USF-4(CR-39): American Technical Physics)

Optical stimulated detector (OSL Al2O3:C : Landauer Inc.)

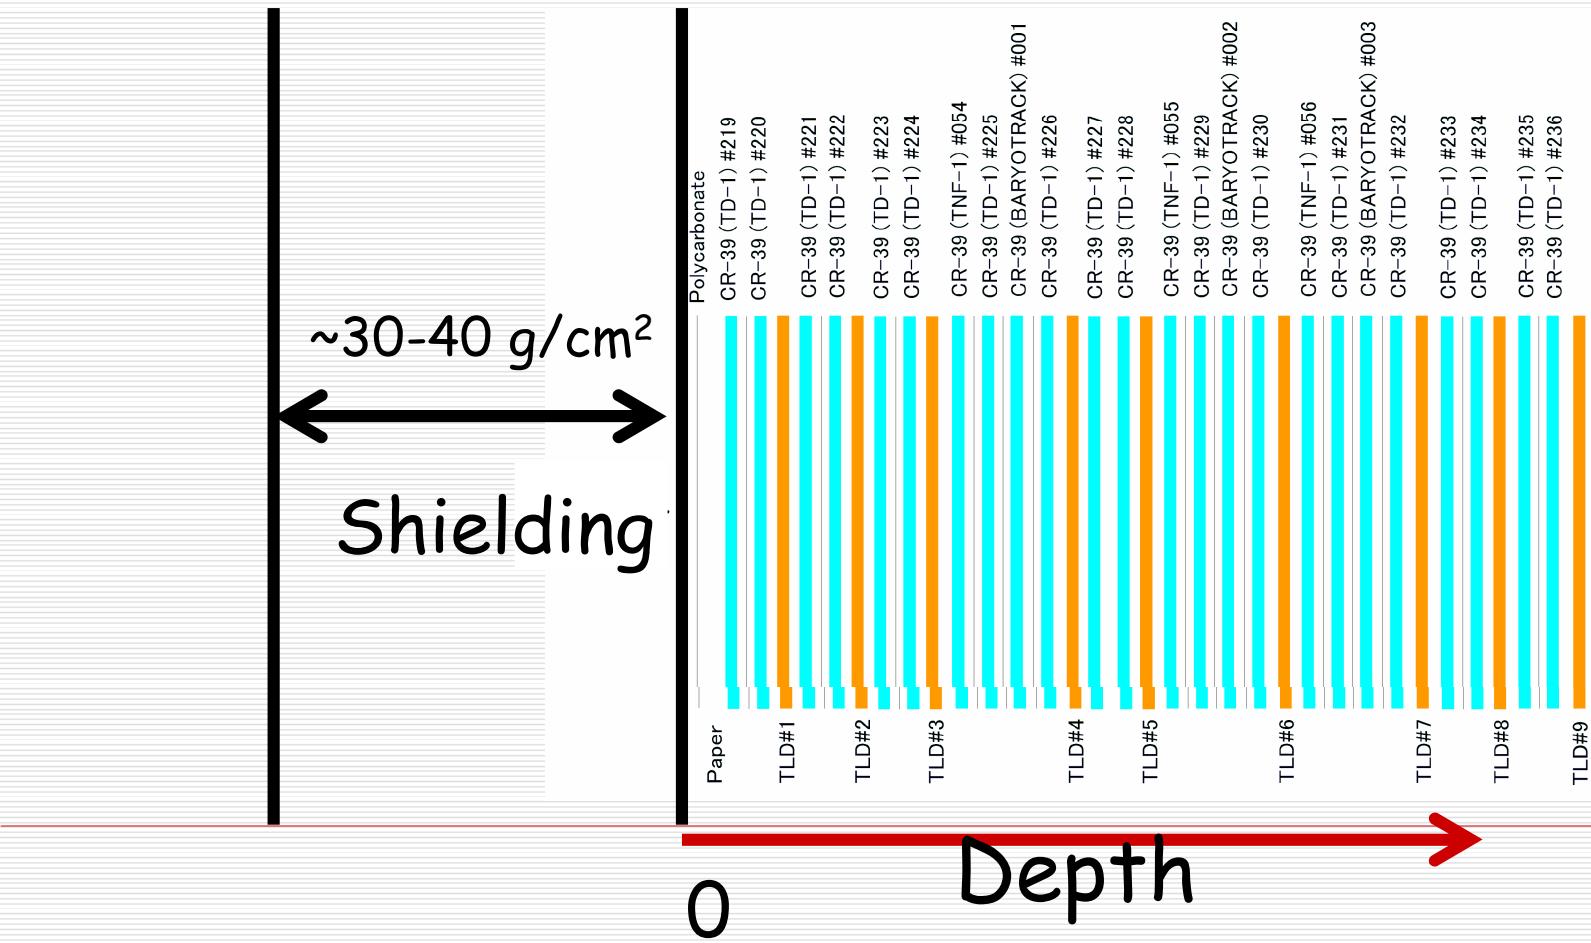

Detector assembly

^bEfficiency function method.

^cSlow cool annealing

ICCHIBAN-2

Short summary for luminescence detectors

- TLD dose were estimated to be 15 - 25 mGy/91.5days.
- TLD dose was gradually decreased (~10% or more) with depth (~4 g/cm²) from the wall.

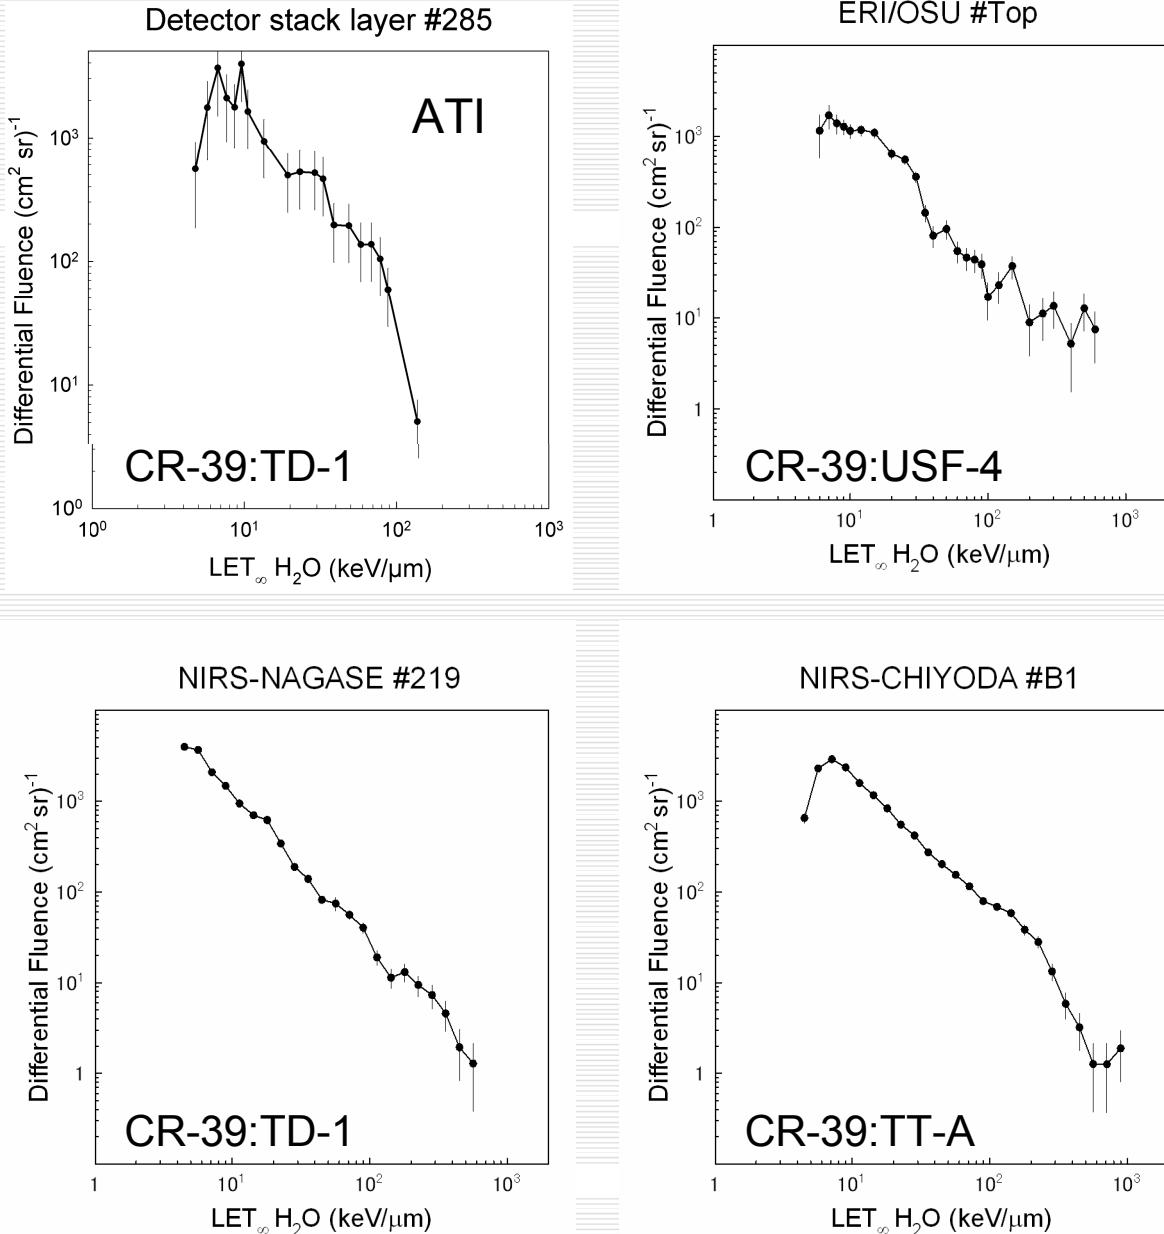

- We found big difference ($\pm \sim 25\%$).
- It can not explain using the results from the ICCHIBAN-2 (Blind#1) ($\pm 10\% @ \text{Max}$).

- Precise calibration for < 10 keV/um
- Fading?
- Incident angle?

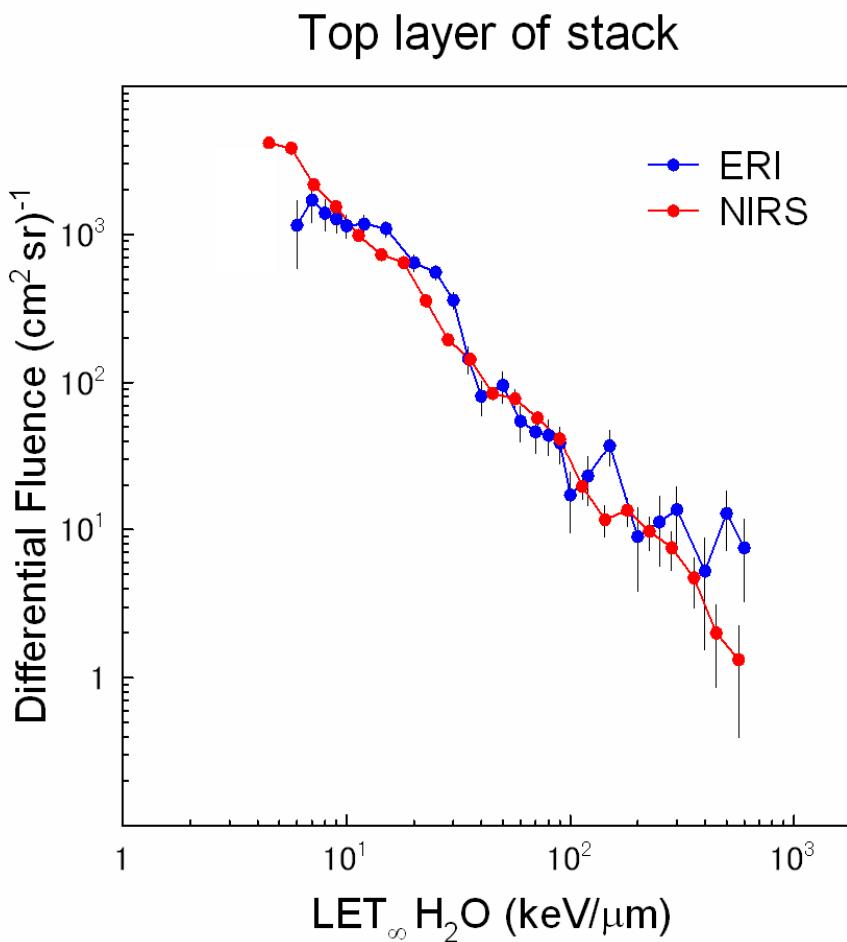

Give me comments !

Short summary for CR-39 results

- High LET component ($LET \geq 10 \text{ keV}/\mu\text{m}$) of dose rate was measured to be $20 - 41 \mu\text{Gy}/\text{day}$.
- For dose equivalent was measured to be $222 - 480 \mu\text{Sv}/\text{day}$.

- We should check more carefully the procedures to extract the dose and dose equivalent.
 - Methodology
 - Material/Etching
 - Calculation
 - Skill

We should prepare the standard (guide).

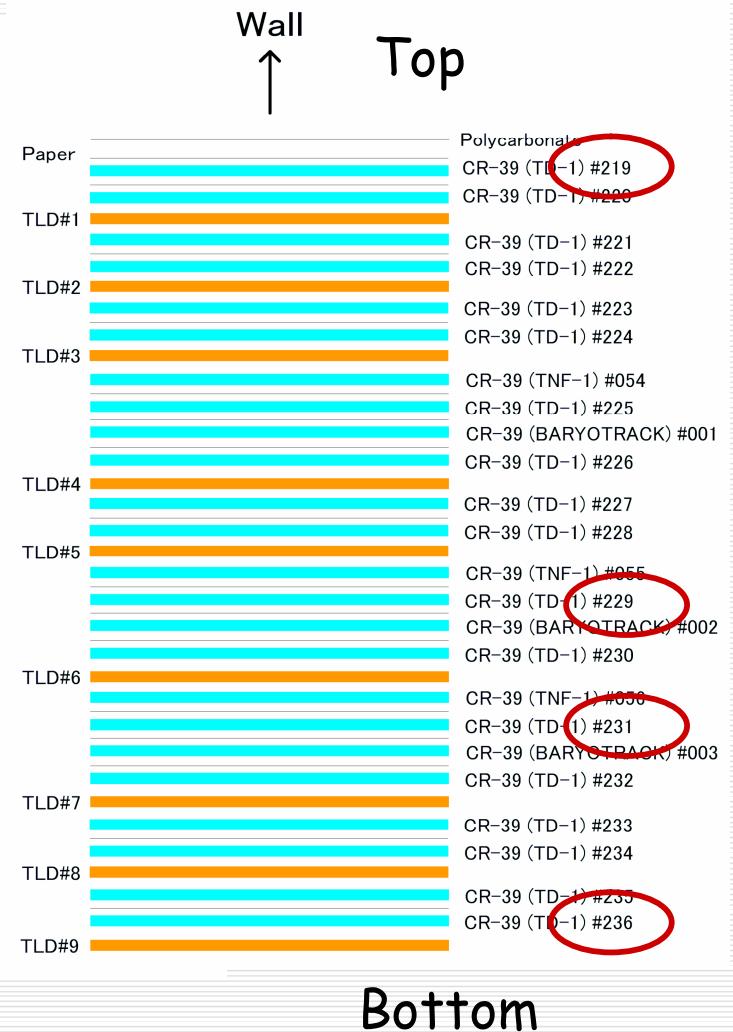

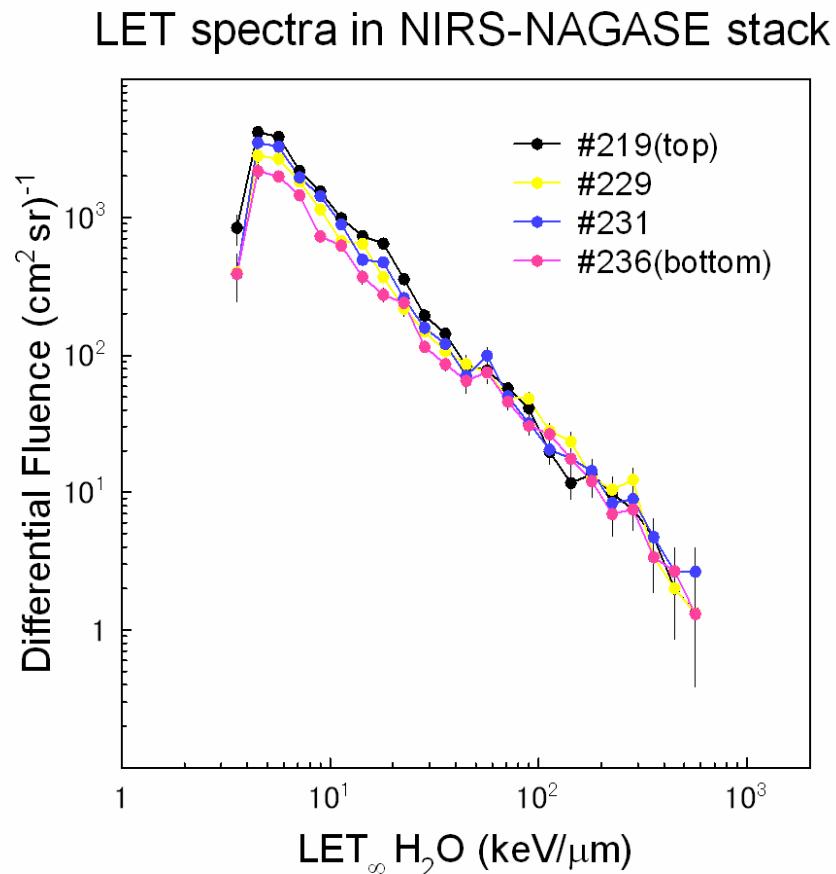

Comparison of results for top layer (TLD + CR-39)

Dose Equivalent rate $\geq 10 \text{ keV}/\mu\text{m}$ ($\mu\text{Sv/day}$)	222 ± 9 (53%)	222 ± 9 (52%)	410 ± 13 (53%)	410 ± 13 (50%)	304 ± 24 (58%)	480 ± 176 (64%)	—
Total Dose Equivalent Rate ($\mu\text{Sv/day}$)	415 ± 14	430 ± 10	592 ± 13	577 ± 14	528 ± 51	744 ± 182	491 ± 10
Averaged Quality Factor	1.95 ± 0.1	1.89 ± 0.10	2.72 ± 0.1	2.84 ± 0.1	2.07 ± 0.2	2.44 ± 0.6	2.03 ± 0.03

Summary

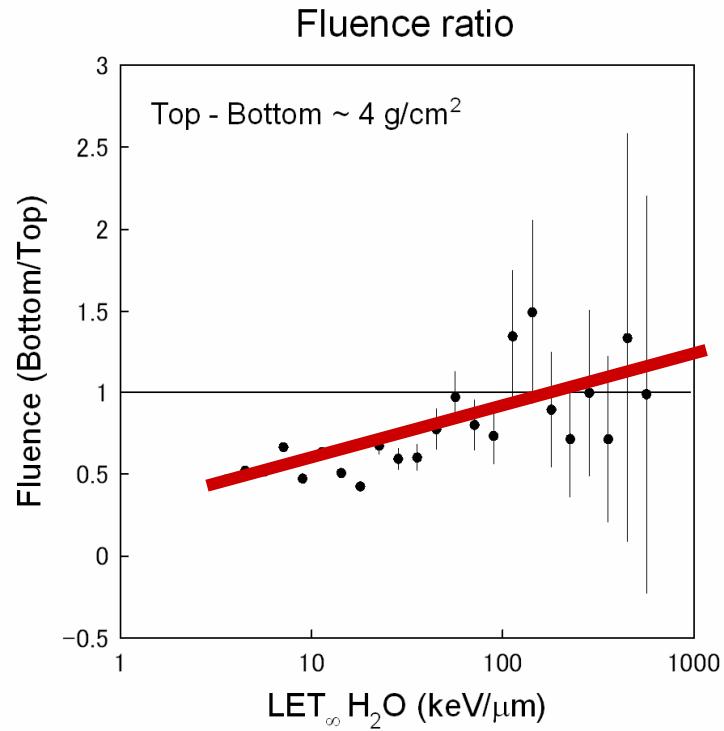

- Contribution of high LET component to total dose : 9 - 18%
 - To Dose equivalent : 50 - 64%
 - We found big differences for both (TLD and CR-39 detectors). Space intercomparison gives quite a lot of knowledge.
 - It should be reflected to grand base ICCHIBAN and should be discuss about the strategy to make "standard".
 - We hope to do the space intercomparison again.
-

Conclusions

- We conducted an intercomparison experiment for passive Radiation dosimeters, Space Intercomparison/BRADOS, aboard the International Space Station.
 - The absorbed dose rates at the wall of the Flight Engineer's sleeping quarter were measured as a function of depth from the wall.
 - Preliminary results shows that the absorbed dose rates was about 250 $\mu\text{Gy}/\text{day}$, and gradually decreased (~10% or more) with depth.
 - We plan a future experiment of larger scope to include passive dosimeters from all laboratories participating in the ICCHIBAN project.
-
