² Lockheed Martin, Houston, TX

Outline

- ① CAD Model Updates
- ① RAM Data
- ① Model Inputs/Assumptions
- ① RAM Data vs Model

CAD Model Updates

- ◎ Large effort by LaRC to update the ISS CAD models
 - Focus on accuracy of mass at the level of each rack
 - Module mass checked for accuracy
- ◎ A couple of remaining caveats
 - Additional stowage is not accounted for
 - Smoothed masses at the rack level could have some large impacts for points close to these smoothed masses

RAM Data

- ◎ RAMs flown on ISS
 - Launch: September 2, 2015
 - Return: June 18, 2016
 - Expedition Duration: 290.2 days
 - Average Orbital Altitude: 403.2km
 - Inclination: 51.6 degrees
 - Model compared to TLD-300 data

Simulation Description

- MeRIT (**M**ulti-**e**nvironment **C**ancer **R**isk **A**nalysis **T**ool) software tool that makes use of LaRC scripts (similar to OLTARIS)
 - Transport – HZETRN
 - Shields – CAD model raytraced with 10000 rays
 - Environment
 - Trapped – AP8 Model modified for ISS orbit using past datasets
 - GCR – BON2014 for Dec 2-20, 2015
 - Trajectory – ISS 1 minute trajectory for Dec 2-12, 2015

Node2 Axis

Conclusions

- Updated CAD model results show characteristics of the model that would be expected.
- RAM data vs model compare well in most cases
- There are still some areas with smoothed mass that need more work
- Supplemental stowage needs to be added into the model

Questions?

RAM Label	Location Description
COL_EPM	Face of European Physiology Module Rack (COL1A3), above Right Utility Distribution Panel.
COL_EDR	Face of European Drawer Rack (COL1F1), on Lower Utility Distribution Panel.
