Environmental Data App

The Environmental Data App (EDA) is a portal where users can visualize and compare International Space Station (ISS) environmental telemetry data and radiation data gathered from spaceflight missions. On the Mission Dashboard the users can visualize Temperature, Carbon dioxide (CO₂), and Relative Humidity measurements and Radiation doses recorded on the ISS and ground control for the duration of the mission. The Mission Comparison feature can be used to visualize data across multiple missions. Raw and summary data is available for download on the Data Tables tab through the Data Tables section.

[Rodent Research 9 \(SpaceX-12\)](#)

The spaceflight environment is known to result in significant physiological changes on many aspects of the body during long-duration mission in low Earth orbit, posing hazards to the astronauts. This mission's primary objective is to use mice to better understand the visual impairment and joint tissue degradation that are affecting astronauts living in space for long periods of time, and to examine possible ways to counteract those health problems. NASA is also working to maximize science return from this mission by sharing tissues from the animals with as many NASA investigators as possible.

The RadLab portal and the RadLab data API

RadLab is a portal that aims to provide a single point of access to radiation telemetry data from multiple databases maintained by multiple space agencies.

The Web interface provides the ability to query, visualize, inspect, and download data; for example, [time series plots](#) of readings from multiple radiation detectors, [pairwise comparisons](#) of detector readings, and [geospatial visualizations](#) of radiation dose and flux registered by the detectors.

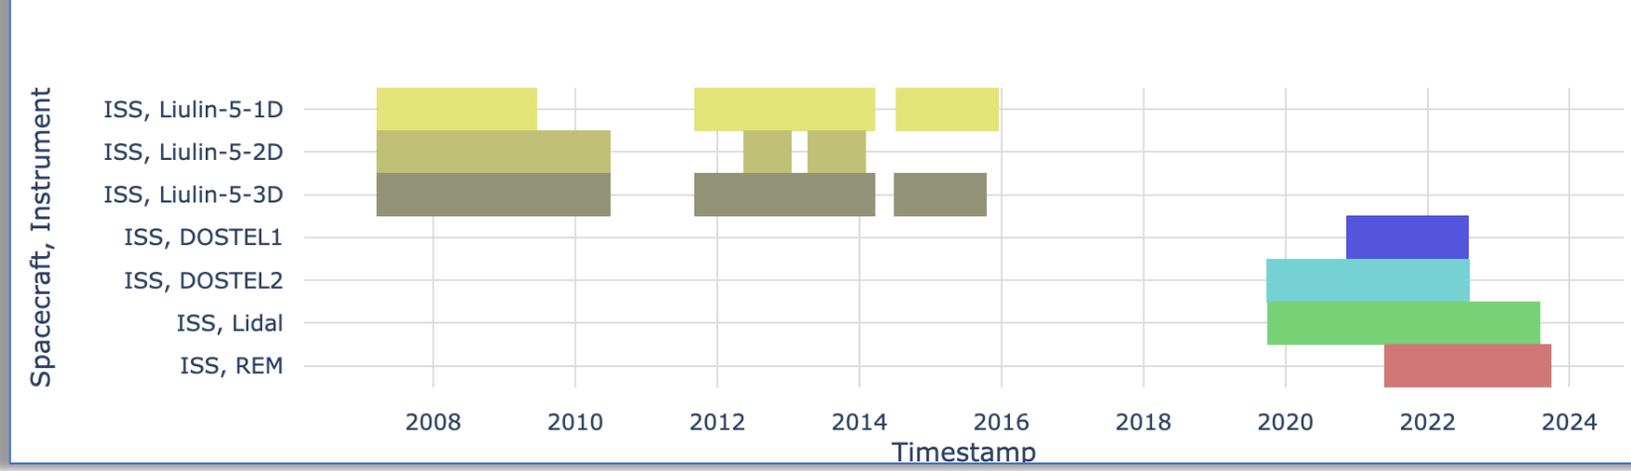

[The underlying API](#) enables data selection and retrieval at a programmatic level.

The demo version of RadLab contains the data obtained from four detectors included in the DORELI project (DOSTEL1, DOSTEL2, Lidal, REM; [Italian Space Agency](#)) and the data from three Liulin-5 detectors ([Bulgarian Academy of Sciences](#)). All seven detectors are/were located on the International Space Station (ISS).

Multiple JSON formats

The image shows two side-by-side screenshots of a JSON viewer application. The left screenshot displays a 'columns' view where each data point is a flat object with keys for spacecraft, instrument, source, timestamp, dose_rate_total, latitude, longitude, altitude, b, and l. The right screenshot displays a '0:' view where the data is organized into an array of objects, each representing a row of data with the same keys as the left view.
